

Medicaid populations are prescribed opioids at a disproportionately higher rate than non-Medicaid populations and are

twice as likely to suffer an overdose.

Source: National Academy for State Health Policy Survey March - June 2016

Recent studies have shown patients with spinal pain, under the care of a Chiropractic Physician are

64% less likely to receive an opioid prescription,

and 51% less likely to suffer an adverse drug event, such as overdose or death.
